Lisa Vroomen 100% YES and the reason our team was tagged to substantiate the mechanisms of interaction linking EMFs to real world problems. We have an unparalleled 41 year background isolating electrical, mechanical, chemical and other failures before they happen.

There are real reasons we wire the world and confine EMFs to an insulated conductor. Gas, refinery and other classed areas are designed as well as constructed to avoid or contain an explosion. An electrical arc or spark could cause explosions so we use flexible conduit to contain the electrical explosion. Rigid conduit has at least 5 threads for gas inside pipe to dissipate.

Have you ever walked across a carpet and gave someone a shock when you touched them? That in itself can cause fires or explosions and insurers won't pay out on EMF claims. Industries, academia, medicine, and different levels of governing don't realize what politics has created and it is a liability nightmare.

Politicians would never be cleared to visit these classed areas or they could get injured or killed. If you called an electrical professional asking how much electrical current you can induce into the neighbor, the police would respond.

Let's keep this simple for real, the wireless industry can't mass deploy as they have. The fact they can lobby a politician at all are conflicts of interest with serious liability including criminal. If you called the local police department and asked them how long you can put the baby in the microwave for on low? Police, fire, ambulance, SWAT and the response would be immediate. If someone put a baby in the microwave, police would respond and their life would be taken.

People need to understand the basics, in order for wireless to work you have to be inside the wireless electrical circuit. If it was legal, everyone would get dividends for being inside the wireless circuit. The only building to withstand EMF and EMI is an MRI Chamber. Wireless as applied today is destroying infrastructure not designed for these vibrations billions of times per measurable second.

Wireless can't supersede Building Codes or any vibration codes. The FCC as an example wants to increase the power density in the atmosphere? That means they want to use more wireless devices on the electrical circuit with you in it.

Politicians may think they are invincible, they are not above the law and all the

laws are there now. If you didn't take this letter to your doctor or medical professionals, you are screwing yourself up. The letter applies to all health professionals as they require ongoing education credits for licensing. Sharing it with your health professionals validates the wireless EMFs are harming you and changed diagnosis without informing your doctor.

I was asked to do a submission for the Canadian Nuclear Safety Commission regarding a nuclear power plant inside Toronto City Limits. You will see the letter and the evidence which includes the Building Code rule on vibration.

100% of this applies to your own area and your elected officials are not informed. You are NOT electro hypersensitive to your electrocution. Inducing current but killing you slowly. Symptoms across the board, flu, pandemic, virus and unbelievable climate hell.

Lisa Vroomen, I can't apologize enough to you and others but it will be stopped, it is illegal.
